

### Meeting Summary - Group 2 (Feb 9 - Feb 12)

For this week's meeting, our group decided to focus on reviewing our project progress and organizing the next steps. We met for approximately two hours, during which we split roles and assigned specific tasks to each team member.

We discussed the current state of the project, identified areas for improvement, and reviewed what needed to be added, deleted, or fixed. This included both backend and frontend components, as well as overall project structure and documentation. Each member worked on their assigned tasks during and after the meeting to ensure steady progress.

Several improvements were made to our GitHub repository, including better organization and updates to recent changes. Throughout the week, we developed and refined multiple components such as the Data Populator, Rule Searcher and Sorter, and database Schemas. We also made improvements to the JavaFX user interface to enhance usability and overall design. Additionally, we added more data to our SQLite database to support testing and functionality.

Overall, the meeting was productive, and we made solid progress on both development and project organization.
